

Detecting Effects of IASIS Micro Current Neurofeedback Intervention Using Magnetoencephalography (MEG) and Electroencephalography (EEG) in Veterans - A Pilot Study

Category

PTSD/TBI

Enrollment Closing Date

May 27, 2017

Description

Dr. Huang and VA Co-I's are conducting research to find out more about traumatic brain injury (TBI) with or without post traumatic stress disorder (PTSD) and testing the validity of a neurofeedback treatment (IASIS Micro Current Neurofeedback - that measures abnormal brainwaves and sends back a weak electric signal to disrupt the abnormal brain waves). Sessions = MEG, MRI, EEG, Mental Health Assess., Neuropsych testing, and 12 sessions of IASIS treatment.

Requirements

- * Veterans with a diagnosis of TBI and/or PTSD
- * Age 18 - 65
- * No metal objects in the body unless removable

Benefits

There may or may not be a direct benefit to you from these sessions. However, IASIS Neurofeedback treatment is provided to you at no cost.
